

CHS, Inc.

St. Paul, MN

Marcus Construction was brought in as the specialist for CHS's challenging renovation project that included demolition of their aged 10,000 ton facility and replaced it with a 20,000 ton facility on the same footprint and incorporated both new and existing equipment. There are numerous things to consider with these complicated projects such as permitting, demolition, disposal of materials, geotechnical, testing of existing pilings and structure, and incorporating existing and new equipment to name a few. Marcus brought innovative solutions to the drawing board and guided CHS through the process from demolition of their old facility through the completion of their new, efficient river facility. This facility has barge and rail receiving, and shipments out on rail and truck.
